UTILITY PATENT APPLICATION
UNDER 37 CFR 1.53(b)

Box PATENT APPLICATION

Assistant Commissioner for Patents

Washington, DC 20231

Sir:

Transmitted herewith for filing is the patent application of:

INVENTOR: Hiroki YOSHIDA

FOR: IMAGE PROCESSING APPARATUS AND METHOD

Enclosed are:

- ☒ 22 pages of specification, claims, abstract.
- ☒ Declaration and Power of Attorney.
- ☒ Priority Claimed.
- ☒ Certified copy of Japanese Patent Application No. 11-229181
- ☒ 8 sheets of formal drawing.
- ☒ An assignment of the invention to MINOLTA CO., LTD.
and the assignment recordation fee.
- ☐ An associate power of attorney.
- ☐ A verified statement to establish small entity status under 37 CFR 1.9 and 37 CFR 1.27.
- ☒ Information Disclosure Statement, Form PTO-1449 and reference.
- ☒ Return Receipt Postcard
- ☐

The filing fee has been calculated as shown below:

	NO. OF CLAIMS		EXTRA CLAIMS	RATE	AMOUNT
Total Claims	10	-20	0	\$18.00	\$0.00
Independent Claims	4	-3	1	\$78.00	\$78.00
Multiple Dependent Claim(s)					\$0.00
Basic Fee					\$690.00
Total of Above Calculations					\$768.00
Less ½ for Small Entity					\$0.00
Assignment & Recording Fee					\$40.00
Total Fee					\$808.00

☒ Please charge my Deposit Account No. 500417 in the amount of \$808.00. A duplicate copy of this sheet is enclosed.

☒ The Commissioner is hereby authorized to charge payment of the following fees associated with this communication or credit any overpayment to Deposit Account No. 500417. A duplicate copy is enclosed.

☒ Any additional filing fees required under 37 CFR 1.16.

☒ The Commissioner is hereby authorized to charge payment of the following fees during the pendency of this application or credit any overpayment to Deposit Account No. 500417. A duplicate copy of this sheet is enclosed.

☒ Any patent application processing fees under 37 CFR 1.17.

☒ Any filing fees under 37 CFR 1.16 for presentation of extra claims.

Respectfully submitted,

MCDERMOTT, WILL & EMERY

Edward J. Wise

IMAGE PROCESSING APPARATUS AND METHOD

The present application claims priority to Japanese Patent Application No. 11-229181 filed August 13, 1999, the entire content of which is hereby incorporated by reference.

BACKGROUND OF THE INVENTION

FIELD OF THE INVENTION

The present invention relates to a digital image edge enhancement process.

DESCRIPTION OF THE RELATED ART

Digital images input from a digital camera and the like are subjected to various types of image correction. Various methods are used in the edge enhancement process, which is one of these image correction processes. For example, the edge is determined to be between pixels in the image process disclosed in Japanese Laid-Open Patent No. 5-108823. Furthermore, a threshold value which determines the edge is automatically calculated in the image process disclosed in Japanese Laid-Open Patent 10-143673.

Generally, when enhancing the sharpness of a digital image by an edge enhancement process, it is

desirable to adjust the thickness of the edge, i.e., the
'range' of edge enhancement, in accordance with the
characteristics of the photographic object. For example,
when photographing a building or man-made object, the
5 image appears to have an added border when the line of
the contour of the building is thickened, such that the
image appears unnatural. Accordingly, it is desirable to
enhance the line by narrowing the edge enhancement range
so as to not thicken the line in the case of buildings
10 and the like. Conversely, when enhancing an edge by
thinning the edge in the case of a human image and the
like, the enhancement often produces the opposite effect
of making the eyes and the like appear unnatural. For
this reason it is desirable to smoothly enhance the edge
15 by broadening the width of the edge in the case of human
images. That is, when photographing people, the
enhancement range must be somewhat broadened with
moderate edge enhancement. Numerous methods of automatic
edge enhancement have been proposed heretofore, but the
20 enhancement range must be input manually.

SUMMARY OF THE INVENTION

An object of the present invention is to
provide an image processing apparatus capable of
25 automatically accomplishing suitable edge enhancement.

Another object of the present invention is to provide an image processing apparatus capable of excellent edge enhancement for human images as well as image of man-made objects.

5 These and other objects are attained by an image processing apparatus, comprising edge detecting means for determining the presence/absence of an edge at each pixel of input image data; selecting means for selecting a weighting matrix corresponding to the position of the edge of each target pixel determined to have an edge by the edge detecting means; calculating means for calculating data of the target pixel and the pixels surrounding the target pixel using the weighting matrix selected by the selecting means; enhancement range determining means for determining the range of edge enhancement of the target pixel by comparing the calculation result of the calculating means to a specific threshold value; and edge enhancing means for executing an edge enhancement process on data of object pixels within the enhancement range determined by the enhancement range determining means.

 The present invention is a medium readable by a computer storing computer-executable programs comprising the steps of determining the presence/absence of an edge at each pixel of input image data; selecting a weighting

matrix corresponding to the position of the edge for each target pixel determined to have an edge; calculating data of the target pixel and pixels surrounding the target pixel using selected weighting matrix; comparing the calculation result to a specific threshold value; determining the range of edge enhancement for the target pixel based on the comparison result; and executing an edge enhancement process for the object pixels within the determined enhancement range.

It is desirable that the enhancement range determining means increases the weighting of components corresponding to the interior side of the edge in the weighting matrix.

It is further desirable that the enhancement range determining means selects a weighting matrix based on the presence/absence of an edge in four directions surrounding the target pixel.

It is further desirable that the edge enhancing means executes processing based on the hue and chroma of the pixels surrounding the object pixel.

It is even further desirable that the edge enhancing means executes processing based on the distance of the object pixel to the target pixel.

The invention itself, together with further objects and attendant advantages, will be best understood

by reference to the following detailed description taken
in conjunction with the accompanying drawings.

BRIEF DESCRIPTION OF THE DRAWINGS

5 FIG. 1 shows the overall construction of an
image processing apparatus;

 FIG. 2 is a block diagram of the image
processing apparatus;

 FIG. 3 is a flow chart of edge enhancement;

10 FIG. 4 shows the coordinates within a block of
3x3 pixels;

 FIGS. 5A through 5D show the edge detection
matrices;

 FIG. 6 shows one example of an enhanced pixel;

15 FIG. 7 shows the target pixel and the edge
position;

 FIG. 8 shows the target pixel and the edge
position;

20 FIG. 9 shows the target pixel and the edge
position;

 FIG. 10 shows the target pixel and the edge
position;

 FIG. 11 shows the coordinates within a block of
5x5 pixels;

FIGS. 12A through 12D show examples of
weighting matrices; and

FIG. 13 shows an edge enhancement matrix.

In the following description, like parts are
designated by like reference numbers throughout the
several drawings.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

The embodiments of the present invention are
described hereinafter with reference to the accompanying
drawings.

The image processing apparatus of the present
embodiment of the invention has a controller 1 at its
center for controlling the overall image processing
apparatus provided with a CPU. In FIG. 1, the arrows
represent the flow of data. A display 2 displays images
or text and the like, and displays various types of
screens for operation. A keyboard 3 and mouse 4 are used
for various input and specified operations. A floppy
disk 5 and hard drive 6 are data storage media for
storing and saving image data, and the image processing
apparatus is provided with a floppy disk drive and a hard
disk drive for accessing the floppy disk 5 and the hard
disk 6. A printer 7 prints the image data and the like
on paper. A scanner 8 reads image data from a document.

A CD-ROM 9 is a storage medium for storing large amounts of various types of image data, and the image processing apparatus is provided with a CD-ROM drive to access the CD-ROM 9. A speaker 10 for audio output and a microphone 11 for audio input are connected. An image processing program described later is read from an external storage medium such as the CD-ROM.

FIG. 2 is a block diagram centered on a controller 1. The controller 1 has a CPU 201 at its center, and connected to this CPU 201 via a data bus 220 are a ROM 203 for storing various processing programs and the like, RAM 204 for storing programs and various data, display control circuit 205 for displaying image and text and the like on the display 2, keyboard control circuit 206 for controlling and transferring input from the keyboard, mouse control circuit 207 for controlling and transferring input from the mouse, floppy disk drive control circuit 208 for controlling the floppy disk drive, hard disk control circuit 209 for controlling the hard disk, printer control circuit 210 for controlling output to the printer 7, scanner control circuit 211 for controlling the scanner 8, CD-ROM drive control circuit 212 for controlling the CD-ROM drive, speaker control circuit 213 for controlling the speaker 10, and a microphone control circuit 214 for controlling the

microphone 11. Furthermore, a clock circuit 202 supplies various types of clock signals necessary for the operation of the image processing apparatus. An expansion slot 215 is connected so as to allow connection of various types of expansion ports via the data bus.

The controller 1 performs various types of image processing on a digital image. The digital image edge enhancement process is described below. FIG. 3 shows the flow of the edge enhancement process performed by the controller 1.

First, image data in the RGB color system are converted to image data in the HSL color system (step S10). Then, steps S11~S18 are steps of the edge enhancement process performed on the L component of the image data in the HSL color system of a specific target pixel, and these steps are repeated until the edge enhancement process has been performed on all pixels.

In step S11, a filtering process is executed to detect the edge. Specifically, a 3×3 pixel block comprising a target pixel and the surrounding pixels is extracted, and the block is filtered. The coordinates within this block are defined as shown in FIG. 4. The pixel at coordinates (2,2) is the target pixel. The edge detecting matrices w1 used in this filtering is shown in FIGS. 5A through 5D. For example, FIG. 5A is a filter

for detecting an edge present above the target pixel, and the edge is detected by comparing the value of θ_{1a} determined by equation (1) below to a specific threshold value.

$$\theta_{1a} = \left| \sum_{i=1, j=1}^{i=2, j=3} X_{ij} w_{l_{ij}} \right| \quad (1)$$

Where X_{ij} represents the value of L at coordinates (i, j) , and $w_{l_{ij}}$ represents line i column j component of the edge detecting matrix w_l .

Similarly, FIG. 5B is an edge detecting matrix for detecting an edge present below a target pixel, and the edge is detected by comparing the value of θ_{1b} determined by equation (2) below to a specific threshold value.

$$\theta_{1b} = \left| \sum_{i=2, j=1}^{i=3, j=3} X_{ij} w_{l_{ij}} \right| \quad (2)$$

Similarly, FIG. 5C is an edge detecting matrix for detecting an edge present to the left of a target pixel, and the edge is detected by comparing the value of θ_{1c} determined by equation (3) below to a specific threshold value.

$$\theta_{1c} = \left| \sum_{i=1, j=1}^{i=3, j=2} X_{ij} w_{l_{ij}} \right| \quad (3)$$

Similarly, FIG. 5D is an edge detecting matrix for detecting an edge present to the right of a target

pixel, and the edge is detected by comparing the value of
θ_{ld} determined by equation (4) below to a specific
threshold value.

$$\theta_{ld} = \left| \sum_{i=1, j=2}^{i=3, j=3} X_{ij} w_{l_{ij}} \right| \quad (4)$$

5 In the present embodiment, the edge between
pixels is determined as described above. In this way
edges are naturally enhanced without enhancing only lines
by increasing the difference between both pixels
circumscribing the edge during enhancement. Furthermore,
10 edges present around a target pixel can be limited to
four types by determining the edge between pixels, and
subsequent selection of weighting matrix is simply
accomplished.

15 When an edge is detected at a target pixel
(step S12: YES), the weighting matrix w₂ is selected to
determine the enhancement radius R (step S13). Then, a
block of 5x5 pixels comprising the target pixel and 24
surrounding pixels is extracted, the selected weighting
matrix w₂ is used for filtering this block, and the
20 enhancement radius R is determined (step S14). The
coordinates within this block are defined as shown in FIG.
11. FIGS. 12A through 12D show examples of the weighting
matrices w₂. FIG. 12A shows a weighting matrix w₂ when
an edge is detected at the left side of the target pixel

(FIG. 7), FIG. 12B shows a weighting matrix w2 when edges are detected below and on the left side of the target pixel (FIG. 8), FIG. 12C shows a weighting matrix w2 when edges are detected below, on the left side and on the right side of the target pixel (FIG. 9), and FIG. 12D shows a weighting matrix w2 when an edge is detected on the left and right sides of the target pixel (FIG. 10). In all weighting matrices w2, pixels from a11 to a55 are not 0.

The edge enhancement radius R is a parameter representing the range for enhancing the edge, and is used to determine to which pixel to perform enhancement at the peripheral pixels considered as the edge. For example, the enhancement radius is 1 (pixel) in the example of FIG. 6, and the target pixel and surrounding pixels (shaded area) represent the enhanced pixels obtained by edge enhancement.

Specifically, the enhancement radius R is automatically calculated in accordance with equation (5) below from the image data and weighting matrix w2 using the radius calculation function F(x).

$$R=F(\sum x_{ij}w2_{ij}) \quad (5)$$

Where x_{ij} represents the value of L at coordinates (i,j), and $w2_{ij}$ represents the line i column j component of the weighting matrix w2.

The radius calculation function $F(x)$ is a function such as shown in the examples below.

$$F(x)=1 \text{ when } b1 \leq x < b2$$

$$F(x)=2 \text{ when } b2 \leq x < b3$$

5 Where $b1$ and $b2$ are constants.

10 The edge enhancement range (enhancement radius) should be determined from the slope (gradation) of the luminance of the edge periphery and edge line type (thickness). The edge enhancement radius is closely related to the edge width. When the edge enhancement radius is small, the edge width is thin, and when the edge enhancement radius is large, the edge width is thick. The edge thickness must be adjusted depending on the object. The weighting in the weighting matrix $w2$ is at
15 the opposite side (edge inner side) of the edge position relative to the target pixel. Since the edge enhancement radius is determined using the weighting matrix $w2$, the determined edge enhancement radius is related to the edge width if an edge is in the periphery of the target pixel.
20 When the object is a building, there is a slope point (edge) of acute change in luminance near the object edge, and when the object is a human image, and particularly the photograph of a face, the change in luminance is smooth near the edge. These characteristics are
25 reflected in the edge enhancement radius.

Neutral color	0.6	Enhance text edge
Flesh color	0.7	Produce skin texture
Warm color	0.7	Soft tones are unnatural with hard edges
Other	1.0	

The second enhancement coefficient P2 is determined by the distance from the center pixel of the enhancement. As shown in Table 2, the second enhancement coefficient P2 is calculated for distances 0, 1, 2 (pixels).

Table 2

Distance	P2
0	1.0
1	0.8
2	0.6

The corrected image data $L'(i,j)$ are calculated by equation (6) below using the uncorrected image data $L(i,j)$, the two enhancement coefficients P1 and P2, and the edge enhancement matrix w3 shown in FIG. 13.

$$L'(i,j) = L(i,j) + W * P1 * P2 \quad (6)$$

$$W = \sum L(i,j) * w3ij \quad (7)$$

Where $w3ij$ represents the line i column j component of the edge enhancement matrix w3.

Although the present invention has been fully
described by way of examples with reference to the
accompanying drawings, it is to be noted that various
changes and modification will be apparent to those
5 skilled in the art. Therefore, unless otherwise such
changes and modifications depart from the scope of the
present invention, they should be construed as being
included therein.

WHAT IS CLAIMED IS:

1. An image processing apparatus, comprising:
edge detecting means for determining the
presence/absence of an edge at each pixel of input image
5 data;

selecting means for selecting a weighting
matrix corresponding to the position of the edge of each
target pixel determined to have an edge by said edge
detecting means;

10 calculating means for calculating data of the
target pixel and the pixels surrounding the target pixel
using the weighting matrix selected by said selecting
means;

15 enhancement range determining means for
determining the range of edge enhancement of the target
pixel by comparing the calculation result of said
calculating means to a specific threshold value; and

20 edge enhancing means for executing an edge
enhancement process on data of object pixels within the
enhancement range determined by said enhancement range
determining means.

2. An image processing apparatus according to
claim 1, wherein

said enhancement range determining means
increases the weighting of components corresponding to
the interior side of the edge in the weighting matrix.

3. An image processing apparatus according to
5 claim 1, wherein

said edge detecting means determines the edge
to be between pixels.

4. An image processing apparatus according to
claim 1, wherein

10 said enhancement range determining means
selects the weighting matrix based on the
presence/absence of an edge in four directions
surrounding the target pixel.

5. An image processing apparatus according to
15 claim 1, wherein

said edge enhancing means executes processing
based on the hue and chroma of the pixels surrounding the
object pixel.

6. An image processing apparatus according to
20 claim 1, wherein

said edge enhancing means executes processing
based on the distance of the object pixel to the target
pixel.

7. An image processing method, comprising the
25 steps of:

determining the presence/absence of an edge at
each pixel of input image data;

selecting a weighting matrix corresponding to
the position of the edge for each target pixel determined
to have an edge;

calculating data of the target pixel and pixels
surrounding the target pixel using selected weighting
matrix;

comparing the calculation result to a specific
threshold value;

determining the range of edge enhancement for
the target pixel based on the comparison result; and

executing an edge enhancement process for the
object pixels within the determined enhancement range.

8. An image processing method according to
claim 7, wherein

the weighting of components corresponding to
the interior side of the edge in the weighting matrix is
increased in the step of determining the range.

9. A medium readable by a computer storing
computer-executable programs comprising the steps of:

determining the presence/absence of an edge at
each pixel of input image data;

selecting a weighting matrix corresponding to the position of the edge for each target pixel determined to have an edge;

calculating data of the target pixel and pixels surrounding the target pixel using selected weighting matrix;

comparing the calculation result to a specific threshold value;

determining the range of edge enhancement for the target pixel based on the comparison result; and

executing an edge enhancement process for the object pixels within the determined enhancement range.

10. An image processing apparatus, comprising:
edge detecting means for determining the presence/absence of an edge at each pixel of input image data;

calculating means for calculating data of the target pixel determined to have an edge by said edge detecting means and the pixels surrounding the target pixel using the weighting matrix;

enhancement range determining means for determining the range of edge enhancement of the target pixel by comparing the calculation result of said calculating means to a specific threshold value; and

edge enhancing means for executing an edge enhancement process on data of object pixels within the enhancement range determined by said enhancement range determining means.

ABSTRACT OF THE DISCLOSURE

Generally, when enhancing the sharpness of a digital image by an edge enhancement process, it is desirable to adjust the range of edge enhancement. For example, when photographing a building or man-made object, the image appears to have an added border when the line of the contour of the building is thickened, such that the image appears unnatural. Accordingly, it is desirable to enhance the line by narrowing the edge enhancement range so as to not thicken the line in the case of buildings and the like. Conversely, when enhancing an edge by thinning the edge in the case of a human image and the like, the enhancement often produces the opposite effect of making the eyes and the like appear unnatural. For this reason it is desirable to smoothly enhance the edge by broadening the width of the edge in the case of human images. In the image processing apparatus of the present invention, the edge enhancement range is determined by calculation using a weighting matrix selected in accordance with the presence/absence of an edge on whichever of the sides of a target pixel. Specifically, data of a target pixel and the surrounding pixels are calculated using a weighting matrix selected by a weighting selection means, and the edge enhancement range is determined by comparing this

calculated value to a specific threshold value. The data of pixels within the enhancement range determined in this way are subjected to the edge enhancement process.
